

# White Paper for 'Web Management' Feature

## Product Feature – Web Management

The Web is now one of the most crucial tools for research, social engagement, and communication. We are daily connected to the Web, accessing and using Web-based information and communication through a range of gadgets, including Smartphones and Tablets.

While the Web has become an essential part of our everyday life, there are safety and security issues linked to its use and misuse. We are concerned about the sites being browsed on the Web and the threats posed by ever-lurking malicious software. We are worried about software viruses breaching the security system and corrupting important files or accessing and sharing sensitive information and data, unknown to us.

Now, consider this ...

Your employees are daily connected to the Web, accessing and using Web-based information and communication via Smartphones and Tablets. You are concerned about the sites being browsed on the Web ... if any malicious software has breached your software security system and is accessing and sharing sensitive company and personal data, unknown to the user ... you are concerned about the loss or corruption of important soft files carrying confidential information, financial details, research work, etc. You are also concerned about losing productive company time as your employees seem to be spending inordinate time on the Web for entertainment and social engagement ... you want to regulate the type and number of Websites that can be viewed on gadgets being used for office work.
